

AEGIS – SILENT PROTECTION FOR NIGERIAN COMMUTERS

50%+

of interstate transport operators have experienced armed robbery on their routes.

NBS Crime & Security Perception Survey

42% Operators faced kidnapping attempts

29.1% Nigerians feel most unsafe in public transport

Armed men surround your vehicle on the expressway. You cannot reach for your phone. Calling for help means death. **AEGIS protects you without you touching anything.**

How AEGIS Fires

The phone stays locked. Two sensors detect the attack.
Your family gets alerted in seconds.

01 **Accelerometer + Gyroscope**

Captures violent motion: snatch, drop, bag insertion. On-device ML classifies the pattern in real time.

02 **Audio Classification (Edge TFLite)**

Mic detects distress keywords and aggressive tone. Model runs on the phone's neural processing unit. No cloud round-trip.

03 **Watcher Dashboard (WebSocket Push)**

Family's browser receives alert in under 3 seconds. GPS coordinates, 5-second audio clip, device status.

04 **Zero Screen Activity**

Screen stays black. No notification sound. No vibration. Attackers see a dead phone.

ALERT PUSHED – Family notified with audio + GPS

Edge-First, Network-Agnostic

When 4G dies in forest corridors, AEGIS falls back to 2G SMS. The system does not depend on internet availability.

01 GPS fix cached every 30 seconds

Last-known coordinate survives signal loss

02 Alert compressed to <160 bytes

Fits a single GSM SMS packet

03 Falls back to 2G cellular

Works where WhatsApp and data apps fail

04 Family receives GPS coordinates via SMS

No app install required on their end

~98%

2G SMS coverage across Nigeria

Edge processing runs TensorFlow Lite models on the device's NPU. Audio classification completes in <200ms. GPS cached to non-volatile memory every 30s. Alert packet: 140 bytes, CRC-16 checksum, base64-encoded coordinates.

Trust Is the Product

Nigerians will not install a safety app that records them 24/7. We designed AEGIS so nothing leaves the device unless someone's life is at risk.

01

On-Device Processing

Audio classification runs on the phone's NPU using TensorFlow Lite. No cloud upload. No server sees your data.

02

Auto-Wipe After Processing

Audio buffer clears within 2 seconds of classification. Nothing persists beyond the detection window.

03

Violence-Only Transmission

The 5-second clip sends only when both triggers confirm an attack. False positives stay on-device.

04

Dark by Design

No notification. No LED. No vibration. Attackers see a phone that does nothing. The customer stays safe.

The customer controls the data. Nothing is saved or sent unless their life depends on it.

Capital Allocation & Revenue

We build in Nigeria, for Nigeria. Every naira goes to infrastructure that protects commuters on real roads.

40%

SMS Pipeline & Edge Infra

Wholesale 2G SMS contracts with MTN and Airtel. Alert delivery server. Family notification system.

35%

Fleet Distribution

Partner with 5 major transport companies. Install at motor parks. Reach commuters at ticket checkout.

25%

Engineering & Testing

Highway stress tests on Lagos-Ibadan and Abuja-Kaduna routes. Penetration testing. Sensor calibration.

Per-device: ₦2,000/month · Fleet SaaS: ₦500/seat/month · Target: 500K commuters Year 1 · Break-even: 18 months

We are raising ₦25M seed to launch.

AEGIS protects you silently when speaking could cost your life.
